Agile Sprint Simulation: Reflection Questions

PES1UG24CS908

SANJANA MEDARAMETLA

SECTION I

1. Did your estimations reflect the actual effort?

Answer: Yes, the estimations using the Fibonacci scale accurately represented relative effort. Complex, multi-step workflows like logging medical records and submitting background screening questionnaires were allocated 5 points due to database validation and security constraints, whereas straightforward tasks like multi-attribute filtering and status tracking were estimated at 2 to 3 points.

2. Was your backlog well-prioritized?

Answer: Yes, the backlog was prioritized using business impact and dependency order. Foundational capabilities, specifically shelter medical intake clearance and pet catalog search were ranked highest for Sprint 1, ensuring core user value before secondary administrative and foster placement features.

3. How did your simulated sprint align with your plan?

Answer: The simulated sprint aligned closely with the planned 1-week timeline and target velocity. User stories progressed smoothly across To Do → In Progress → Done without unplanned scope creep or carryover work.

4. What insights did the burndown chart give about your team's capacity?

Answer: The burndown chart illustrated work completion against the ideal guideline. The sharp vertical drops highlight batch task closures, indicating that decomposing user stories into smaller daily subtasks would result in a smoother, more continuous burndown trajectory.
